"?id=", flag.ID) } else { return nil } 1. Field of the Invention The present invention relates to a communication apparatus, and more particularly to a communication apparatus which is capable of achieving a call setup for a plurality of subscribers on a single trunk. 2. Related Background Art In recent years, the number of telephone subscribers has dramatically increased, and the overall volume of traffic has increased remarkably. In order to handle the traffic effectively, the number of lines connected to a telephone exchange has increased and the port number of the exchange has increased. The increase in the number of lines and the increase in the port number of the exchange are implemented by a method in which a number of branches having the same functions and circuit capacities are connected to a single trunk, and a method in which a number of trunks are connected to a single branch. The latter method has the following disadvantages. First, if the traffic in the trunk is heavier than expected, the addition of lines is necessary in order to improve the total communication capacity. As a result, the increase in cost is significant. Secondly, since a number of circuits are shared, the capacity of each circuit cannot be expanded. Thirdly, a part of a call is transferred between trunks by means of a call transfer. A call from the trunk which accommodates a call is transferred
